Dengue virus M ectodomain peptide fusion protein containing the M precursor translocation signal sequence induced apoptosis in mouse neuroblastoma Neuro 2a and human hepatoma HepG2 cancer cells. - AB The present invention relates to anti-West Nile virus E protein (WNE) antibodies, including human antibodies, and antigen-binding portions thereof. In particular, the invention relates to such antibodies and portions that prevent, inhibit, or treat a flavivirus infection, including a West Nile Virus infection. The invention also relates to antibodies that are chimeric, bispecific, derivatized, single chain antibodies or that are portions of fusion proteins. The invention also relates to isolated heavy and light chain Igs derived from human anti-WNE antibodies and nucleic acid mols. encoding such Igs. The present invention also relates to methods of making human anti-WNE antibodies, compns. comprising these antibodies and methods of using the antibodies and compns. for diagnosis, prophylaxis and treatment. The invention also provides gene therapy methods using nucleic acid mols. encoding the heavy and/or light Ig mols. that comprise the human anti-WNE antibodies. The invention also relates to transgenic animals or plants comprising nucleic acid mols. of the present invention.

CORPORATE SOURCE: Howard Hughes Medical Institute, Children's Hospital and Harvard Medical School, Boston, MA, 02115, USA SOURCE: Nature (London, United Kingdom) (2004), 427(6972), 313-319 CODEN: NATUAS; ISSN: 0028-0836 PUBLISHER: Nature Publishing Group DOCUMENT TYPE: Journal LANGUAGE: English Entered STN: 21 Jan 2004 AB Dengue virus enters a host cell when the viral envelope glycoprotein, E, binds to a receptor and responds by conformational rearrangement to the reduced pH of an endosome. The conformational change induces fusion of

viral and host-cell membranes. A three-dimensional structure of the soluble

E ectodomain (sE) in its trimeric, postfusion state reveals striking differences from the dimeric, prefusion form. The elongated trimer bears three fusion loops' at one end, to insert into the host-cell membrane.

Their structure allows us to model directly how these fusion loops interact with a lipid bilayer. The protein folds back on itself, directing its carboxy terminus towards the fusion loops. We propose a fusion mechanism driven by essentially irreversible conformational changes in E and facilitated by fusion-loop insertion into the outer bilayer leaflet. Specific features of the folded-back structure suggest strategies for inhibiting flavivirus entry.

AB The induction of apoptotic cell death is a prominent cytopathic effect of dengue (DEN) viruses. One of the key questions to be addressed is which viral components induce apoptosis in DEN virus-infected cells. This study

investigated whether the small membrane (M) protein was involved in the induction of apoptosis by DEN virus. This was addressed by using a series of enhanced green fluorescent protein-fused DEN proteins. Evidence is provided that intracellular production of the M ectodomains (residues M-1 to M-40) of all four DEN serotypes triggered apoptosis in host cells such as mouse neuroblastoma Neuro 2a and human hepatoma HepG2 cells. The M ectodomains of the wild-type strains of Japanese encephalitis, West Nile and yellow fever viruses also had proapoptotic properties. The export of the M ectodomain from the Golgi apparatus to the plasma membrane appeared to be essential for the initiation of apoptosis. The study found that anti-apoptosis protein Bcl-2 protected HepG2 cells against the death-promoting activity of the DEN M ectodomain. This suggests that the M ectodomain exerts its cytotoxic effects by activating a mitochondrial apoptotic pathway. The cytotoxicity of the DEN M ectodomain reflected the intrinsic proapoptotic properties of the nine carboxy-terminal amino acids (residues M-32 to M-40) designated ApoptoM. Residue M-36 was unique in that it modulated the death-promoting activity of the M ectodomain. Defining the ApoptoM-activated signalling pathways leading to apoptosis will provide the basis for studying how the M protein might play a key role in the fate of the flavivirus-infected cells. 10-1 (Microbial, Algal, and Fungal Biochemistry) dengue virus M protein apoptosis ApoptoM Proteins RL: BSU (Biological study, unclassified); BIOL (Biological study) (Bcl-2; dengue virus M protein contains proapoptotic sequence referred to as ApoptoM) Animal cell line (Hep G2; dengue virus M protein contains proapoptotic sequence referred to as ApoptoM) Proteins RL: BSU (Biological study, unclassified); BIOL (Biological study) (M (matrix); dengue virus M protein contains proapoptotic sequence referred to as ApoptoM) Protein motifs (M ectodomain; dengue virus M protein contains proapoptotic sequence referred to as ApoptoM) Animal cell line (N2A; denque virus M protein contains proapoptotic sequence referred to as ApoptoM) Apoptosis Cell membrane Dengue virus Golgi apparatus Human Mitochondria Protein sequences Signal transduction, biological (dengue virus M protein contains proapoptotic sequence referred to as ApoptoM) THERE ARE 47 CITED REFERENCES AVAILABLE FOR THIS REFERENCE COUNT: 47 RECORD. alternative strategy for the development of dengue virus

AB A recombinant replication-defective adenovirus vector that can overexpress the ectodomain of the envelope protein of dengue virus type 2 (NGC strain) has been constructed. This virus was immunogenic in mice and elicited dengue virus type 2 specific B- and T-cell responses. Sera from immunized mice contained neutralizing antibodies that could specifically recognize dengue virus type 2 and neutralize its infectivity in vitro, indicating that this approach has the potential to confer protective immunity. In vitro stimulation of splenocytes (from immunized mice) with dengue virus type 2 resulted in a significant proliferative response accompanied by the production of high levels of gamma interferon but did not show significant changes in interleukin-4 levels. This is suggestive of a Th1-like response (considered to be important in the maturation of cytotoxic T lymphocytes that are essential for the elimination of virus-infected cells). The data show that adenovirus vectors offer a promising

AB Dengue virus is an emerging global health threat. Its major envelope glycoprotein, E, mediates viral attachment and entry by membrane fusion. A crystal structure of the soluble ectodomain of E from dengue virus type 2 reveals a hydrophobic pocket lined by residues that influence the pH threshold for fusion. The pocket, which accepts a hydrophobic ligand, opens and closes through a conformational shift in a beta-hairpin at the interface between two domains. These features point to a structural pathway for the fusion-activating transition and suggest a strategy for finding small-molecule inhibitors of dengue and other flaviviruses.

Dengue virus (DV) is a mosquito-borne flavivirus that causes AB haemorrhagic fever in humans. DV primarily targets immature dendritic cells (DCs) after a bite by an infected mosquito vector. Here, we analysed the interactions between DV and human-monocyte-derived DCs at the level of virus entry. We show that the DC-specific ICAM3-grabbing non-integrin (DC-SIGN) molecule, a cell-surface, mannose-specific, C-type lectin, binds mosquito-cell-derived DVs and allows viral replication. Conclusive evidence for the involvement of DC-SIGN in DV infection was obtained by the inhibition of viral infection by anti-DC-SIGN antibodies and by the soluble tetrameric ectodomain of DC-SIGN. Our data show that DC-SIGN functions as a DV-binding lectin by interacting with the DV envelope qlycoprotein. Mosquito-cell-derived DVs may have differential infectivity for DC-SIGN-expressing cells. We suggest that the differential use of DC-SIGN by viral envelope glycoproteins may account for the immunopathogenesis of DVs.

The E-prM proteins of flaviviruses are unusual complexes which play AB important roles in virus assembly and fusion modulation and in potential immunity-inducing vaccines. Despite their importance, little is known about the biogenesis and structural organization of E-prM complexes. Pulse-chase radiolabeling of dengue virus-infected Vero cells demonstrated a rapid interassociation of E and prM proteins, and sucrose gradient sedimentation analysis suggested that E-prM complexes progressed from simple heteromers to more densely sedimenting structures indicating increased multimerization. E-prM heteromers of even higher complexity were observed in virus particles, suggesting an intracellular assembly process which results in the networking of E-prM subunits into a lattice-like structure found in virus particles. Trypsin cleavage of E-prM-containing virus particles resulted in the release of a soluble 45-kDa fragment of the E protein which retained cell-binding activity. The results suggest that E-prM interactions in dengue virus particles are largely mediated by domains in the carboxy-terminal anchoring domain of E, while cell-binding activity is retained in a trypsin-releasable ectodomain of the E protein.

> NOVELTY - A recombinant Flavivirus comprising a membrane protein mutation, is new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for:

- (1) a vaccine composition comprising the Flavivirus above and a pharmaceutical carrier or diluent;
- (2) inducing an immune response to a Flavivirus in a patient by administering the vaccine composition;
- (3) producing a vaccine composition comprising a recombinant Flavivirus by introducing a mutation into the membrane protein of the Flavivirus;
- (4) a nucleic acid molecule corresponding to the genome of the Flavivirus comprising a membrane protein mutation; and
- (5) manufacturing the Flavivirus with a membrane protein mutation by introducing a nucleic acid molecule corresponding to the virus genome into cells and isolating Flavivirus produced in the cells from the cells or the culture supernatant.

ACTIVITY - Virucide.

No biological data given.

MECHANISM OF ACTION - Vaccine.

USE - The Flavivirus, vaccine composition and method are useful for inducing an immune response to a Flavivirus. The virus is preferably a Japanese encephalitis virus, West Nile virus, yellow fever virus, dengue virus, St. Louis encephalitis virus, Murray valley encephalitis virus, or tick-borne encephalitis virus. (All claimed). Dwg.0/9

NOVELTY - Identifying antibody using programmed computer comprising inputting into input device a nucleic acid sequence of open reading frames (ORF) in genome of infectious microorganism, screening nucleic acid sequence to identify ORF encoding protein expressed on surface of microorganism, producing antibody that binds to ectodomain of protein and determining whether antibody inhibits pathogenicity of infectious microorganism, is new.

DETAILED DESCRIPTION - A computer-based method (M1) of identifying an antibody that inhibits infection, which uses a programmed computer comprising a processor and an input device, involves providing the nucleic acid sequence of several open reading frames (ORF) in the genome of an infectious microorganism, inputting to the input device the nucleic acid sequence, screening the nucleic acid sequence using the processor, to identify an open reading frame encoding a protein that is predicted to be expressed on the surface of the infectious microorganism, producing an antibody that binds to the ectodomain of the protein, and determining whether the antibody inhibits the pathogenicity of the infectious microorganism.

INDEPENDENT CLAIMS are also included for:

- (1) manufacturing (M2) a compound, involves performing (M1) and after determining that the antibody inhibits the pathogenicity of the infectious microorganism, and manufacturing a compound comprising at least a portion of the ectodomain;
- (2) manufacturing (M3) an antibody, involves performing (M1) and after determining that the antibody inhibits the pathogenicity of the infectious microorganism, manufacturing the antibody;
 - (3) a compound manufactured by (M2);
- (4) inducing an immune response in an animal, involves performing (M1) and after determining that the antibody inhibits pathogenicity of the

infectious microorganism, administering a compound comprising at least a portion of the **ectodomain** to an animal susceptible to infection with the infectious microorganism;

- (5) treating (M4), involves performing (M1) and after determining that the antibody inhibits, pathogenicity of the infectious microorganism, administering the antibody to an animal;
 - (6) an antibody manufactured by (M3);
- (7) a monoclonal antibody (I) that binds to a protein encoded by the genome of variola virus or a vaccinia virus, where the protein is a protein that is expressed on the surface of the virus or on the surface of a cell infected with the virus; and
 - (8) a humanized antibody derived from (I). ACTIVITY Antimicrobial.

A group of C57BL/6 (B6) mice (n=5) were injected intraperitoneally with a cocktail containing 200 micro g of each of the 11D7, 13E8, and 7D11 monoclonal antibodies. A second group of B6 mice (n=5) were injected intraperitoneally with 600 micro g of a control monoclonal antibody (1A3). Six hours later, the mice in both groups were challenged intranasally with an LD(50) dose (104 PFU) of vaccinia virus (strain WR). On the ninth day after infection, all mice were sacrificed and the amount of virus in their lungs (in PFU/ml) was measured. The animals injected with the cocktail of antibodies showed a dramatic decrease in viral titer compared with the control mice. No virus was detectable in the lungs of animals 6, 7, 9 and 10. About 102 PFU/ml were detected in the lungs of the animals because 102 PFU/ml was the detection limit of the assay. While all the control animals showed severe morbidity starting on day 7 and loss of fat pads, all the experimental animals appeared clinically normal, retained their fat pads, and had no lung pathology at the time of sacrifice.

MECHANISM OF ACTION - Inhibits pathogenicity of microorganisms (claimed).

USE - (M1) is useful for identifying an antibody that inhibits pathogenicity of a infectious microorganism. The infectious microorganism is a virus (such as variola major/minor virus or vaccinia virus). The virus is chosen from hepatitis virus A-E, human papilloma virus, human immunodeficiency virus 1, human T cell lymphotropic virus 1, Herpes virus, Dengue virus 1-4, Ebola virus, Marburg virus, Lassa virus, Machupo virus and influenza virus. The infectious microorganism is a bacterium. The bacterium is Mycobacterium tuberculosis, Mycobacterium leprae, Salmonella bacterium (such as Salmonella typhimurium or Salmonella typhi) or Yersinia pestis. The bacterium is also chosen from Bacillus anthracis, Clostridium botulinum, Francisella tularensis, Corynebacterium diphtheriae, Vibrio cholerae and Escherichia coli. The infectious microorganism is a protozoan parasite such as a malarial parasite or Leishmania. (M1) is useful for manufacturing a compound comprising at least a portion of the ectodomain. (M1) is useful for manufacturing an antibody which inhibits pathogenicity of an infectious microorganism. (M1) is also useful for inducing an immune response in an animal. The immune response is a protective immune response. (M4) is useful for treating by administering an antibody that inhibits pathogenicity of the infectious microorganism. The infectious microorganism is a virus. The virus is an orthopox virus (such as variola or vaccinia virus). The protein is a smallpox growth factor (SPGF) or a VGF (vaccinia growth factor). The monoclonal antibody is the 3D4R-13E8 monoclonal antibody (ATCC Accession Number PTA-5040) or 3D4R-11D7 monoclonal antibody (ATCC Accession Number PTA-5039). The method further involves administering to the animal one or more additional antibodies, where one or more additional antibodies bind to a protein encoded by the infectious microorganism such as an orthopox virus (all claimed). AB
    WO 200196376 A UPAB: 20020319
    NOVELTY - An isolated polypeptide (I) having a fully defined (a)
    Dengue virus (DEN) - 1 M (a membrane protein anchored in envelope
     surrounding the nucleocapsid of the virus) ectodomain sequence,
     (b) Den-1-C amino acid sequence of 95-114 as given in specification, or
     (c) DEN-2 M ectodomain sequence, is new.
          DETAILED DESCRIPTION - (I) has a fully defined sequence of
     SVALAPHVGLGLETRTETWMSSEGAWKQIQKVETWALRHP (DEN-1 M ectodomain)
     (S1) or SVALVPHVGMGLETRTETWMSSEGAWKHAQRIETWILRHP (DEN-2 M
     ectodomain) (S3), or a fully defined Den-1 C amino acid sequence
     (S2) of 95-114 as given in the specification.
          INDEPENDENT CLAIMS are also included for the following:
          (1) an isolated polynucleotide (II) which encodes (I);
          (2) a vector (III) comprising (II);
          (3) a prokaryotic or eukaryotic cell comprising (II);
          (4) a composition comprising (I) or (II) and a carrier;
          (5) an isolated polypeptide (IV) of the sequence of (S1), operably
     linked to (S2);
          (6) an isolated polynucleotide (V) which encodes (IV);
          (7) a vector (VI) comprising (V);
          (8) a prokaryotic or eukaryotic cell comprising (V);
         (9) a composition comprising (IV) or (V) and a carrier;
          (10) screening (M1) for peptides capable of inducing apoptosis
     involves introducing a recombinant protein into the cell, where the
     recombinant protein comprises the peptide to be screened operably linked
     to (S2) and detecting apoptosis in a cell;
          (11) monoclonal antibodies raised against DEN-1 or DEN-2 viral M
     protein;
          (12) plasmid (95-114)EGFP(M10-M40)DEN-2 deposited at the CNCM under
     the accession number I-2684;
          (13) plasmid pTrip Delta U3(95-114)EGFP(206-245)DEN-2 deposited at
     the CNCM under the accession number I-2686;
          (14) plasmid pTrip Delta U3(95-114)EGFP(206-245)DEN-1 deposited at
     the CNCM under the accession number I-2685; and
          (15) plasmid p(95-114)EGFP(215-245)WNV deposited at the CNCM under
     the accession number I-2475.
          ACTIVITY - Virucide; cytostatic.
          MECHANISM OF ACTION - Apoptosis inducer.
          To test the pro-apoptotic activity of the DEN-2 M ectodomain
     the chimeric protein (95-114)EGFP(206-245)DEN-2 was employed. The region
     of the DEN-2 virus strain Jamaica corresponding the M ectodomain
     (DEN-2 polyprotein 206-245) was fused to the C-terminus of the
     (95-114) EGFP fusion construct. The cytotoxicity of the
     (95-114) EGFP (206-245) DEN-2 chimeric protein was tested by transfecting
     cells with FuGENE 6. The expression of the chimeric protein was observed
     by the autofluorescence of the EGFP and apoptotic cell death was detected
     visually by staining with propidium iodide as described above.
```

Intracellular expression of the (95-114)EGFP(206-245)DEN-2 chimeric

protein resulted in cell death. DEN-2 M ectodomain has the ability to induce rapid apoptosis in Neuro 2a, HepG2, HeLa, and VERO cells. Apoptosis was more pronounced after transfection with plasmid (95-114)EGFP(206-245)DEN-2 than after transfection with the plasmid (95-114)EGFP(206-245) containing the sequence of the DEN-1 M ectodomain.

USE - (I) having a sequence of (S3) is useful for inducing apoptosis in the cell of a human patient suffering from cancer or an infection with flavivirus. (I) having a sequence of (S1) or (S3) is useful for screening for molecules which inhibit apoptosis induced by the polypeptide. The method involves introducing the polypeptide into a cell; contacting the cell containing the polypeptide, with the molecule to be screened; and detecting the presence or absence of apoptosis in the cell. The polypeptide which is introduced into the cell is operably linked to the polypeptide of sequence (S2) or (S3) or to a green fluorescent protein. Optionally, the polypeptide is not linked to a green fluorescent protein. Preferably, the polypeptide is introduced into a cell by introducing a polynucleotide (which is an expression vector capable of expressing the polypeptide in a cell) which encodes the polypeptide. (IV) when administered or delivered into a cell is useful for inducing apoptosis in the cell, preferably present in a human patient suffering from cancer or infected with flavivirus. The delivery of (IV) is carried out by delivering a polynucleotide encoding the polypeptide to the cell, where the polynucleotide is in an expression vector suitable to express the polypeptide in the cell (all claimed). The polynucleotides and polypeptides encoded by the polynucleotides as described above are useful for inducing apoptosis, and for treating patients with cancer and patients infected with flavivirus. AB The present invention relates to the development of viral vectors expressing different immunogens from the West Nile Encephalitis Virus (WNV) or the Dengue virus which are able to induce protective humoral and cellular immune responses against WNV or Dengue virus infections. More specifically, the present invention relates to three (3) antigens from WNV (the secreted envelope glycoprotein (E), the heterodimer glycoproteins (pre-M-E) and the NSI protein) and from Dengue virus (the secreted envelope glycoprotein (e), the heterodimer glycoproteins (pre- m-e) and the NSI protein) and their use in vaccinal, therapeutic and diagnostic applications.

AB Apoptotic cell death was involved as a cytopathol. mechanism in response to dengue (DEN) virus infection. Little information exists about how DEN virus replication triggers apoptosis in infected cells. We reported that a 9-residue sequence of the DEN M protein referred to as ApoptoM has proapoptotic properties in transformed and tumor cells of various origins. The aim of the present study was to investigate whether ApoptoM-induced apoptosis is associated to mitochondrial dysfunction and requires caspase activation. Intracellular expression of ApoptoM provokes the disruption of the mitochondrial transmembrane potential without subsequent generation of reactive oxygen species. We showed that ApoptoM-induced apoptosis involves the activation of a caspase-like protease pathway. Caspase-3 like activity was detected in ApoptoM-expressing cells. However, there was no role for caspase-9 in ApoptoM-mediated cell death. These data suggest that a particular mitochondrion-dependent apoptotic pathway may be involved in induction of apoptosis by ApoptoM.

DOCUMENT TYPE: Journal LANGUAGE: English

We have investigated the genetic diversity of dengue type-1 (DEN-1) virus in Brazil. The full nucleotide sequences of three DEN-1 virus isolated from DEN fever (DF) and DEN hemorrhagic fever patients in northeastern Brazil in 1997 (BR/97) and one from a DF patient in the south of Brazil in 2001 (BR/01) were compared to that of the reference strain BR/90 obtained in the city of Rio de Janeiro in 1990. Sequence anal. showed that the structural proteins were remarkably conserved between all isolates. total of 27 amino acid changes occurred throughout the non-structural proteins. Among them, nine amino acid substitutions were specific of BR/97 and BR/01 isolates, indicating that in situ evolution of these strains had occurred. Within the BR/97 and BR/01 samples, some amino acid substitutions have been previously identified in DEN-1 virus strains sequenced so far, suggesting that recombination events might have occurred.

AB The genetic diversity of dengue (DEN) virus was explored using two South American DEN-1 virus strains isolated from viremic human sera. DEN-1 virus strains BR/90 and FGA/89 were selected on the basis of their membrane fusion properties in mosquito cell cultures. Infection of mosquito cell lines with BR/90 virus strain induced a cytopathic effect characterized by syncytium formation whereas no cytopathic changes were observed with FGA/89. Cell-to-cell fusion expts. indicated that the fusogenic activity of FGA/89 required a lower pH than BR/90. Immunoreactivity anal. of the DEN-1 envelope (E) protein with monoclonal antibodies revealed a minor difference between the antigenic structures of FGA/89 and BR/90 virions. FGA/89 was less neurovirulent than BR/90 for newborn mouse. To determine the genetic origin of these modifications, the amino acid sequences of the structural proteins from these virus strains

were compared. One amino acid difference was found within the carboxy-terminal domain of protein C. Five amino acid substitutions were found in the E proteins at positions 96, 180, 297, 379, and 473. Changes at positions 96, 297, and 379 map within two overlapping antigenic domains of protein E. These limited amino acid differences in the E protein could affect the biol. properties and the antigenicity of the DEN virion.

One mechanism by which dengue (DEN) virus may cause cell death AB is apoptosis. In this study, we investigated whether the genetic determinants responsible for acquisition by DEN type 1 (DEN-1) virus of mouse neurovirulence interfere with the induction of apoptosis. Neurovirulent variant FGA/NA dld was generated during the adaptation of the human isolate of DEN-1 virus strain FGA/89 to grow in newborn mouse brains and mosquito cells in vitro [Despres, P. Frenkiel, M. -P. Ceccaldi, P.-E. Duarte Dos Santos, C. and Deubel, V. (1998) J. Virol., 72: 823-829]. Genetic determinants possibly responsible for mouse neurovirulence were studied by sequencing the entire genomes of both DEN-1 viruses. Three amino acid differences in the envelope E protein and one in the nonstructural NS3 protein were found. The cytotoxicity of the mouse-neurovirulent DEN-1 variant was studied in different target cells in vitro and compared with the parental strain. FGA/NA dld was more pathogenic for mouse neuroblastoma cells and attenuated for human hepatoma cells. Changes in virus replicative functions and virus assembly may account, in a large part, for the differences in the induction of apoptosis. Our data suggest that identified amino acid substitutions in the envelope E protein and viral RNA helicase NS3 may influence DEN-1 virus pathogenicity by altering viral growth. AB Dengue virus (DV) is a mosquito-borne flavivirus that causes hemorrhagic fever in humans. In the natural infection, DV is introduced into human skin by an infected mosquito vector where it is believed to target immature dendritic cells (DCs) and Langerhans cells (LCs). We found that DV productively infects DCs but not LCs. We show here that the interactions between DV E protein, the sole mannosylated glycoprotein present on DV particles, and the C-type lectin dendritic cell-specific intercellular adhesion molecule 3-grabbing non-integrin (DC-SIGN) are essential for DV infection of DCs. Binding of mannosylated N-glycans on DV E protein to DC-SIGN triggers a rapid and efficient internalization of the viral glycoprotein. However, we observed that endocytosis-defective DC-SIGN molecules allow efficient DV replication, indicating that DC-SIGN endocytosis is dispensable for the internalization step in DV entry. Together, these results argue in favor of a mechanism by which DC-SIGN enhances DV entry and infection in cis. We propose that DC-SIGN concentrates mosquito-derived DV particles at the cell surface to allow efficient interaction with an as yet unidentified entry factor that is ultimately responsible for DV internalization and pH-dependent fusion into DCs.

AB We report that endoplasmic reticulum alpha-glucosidase inhibitors have antiviral effects on dengue (DEN) virus. We found that glucosidase inhibition strongly affects productive folding pathways of the envelope glycoproteins prM (the intracellular glycosylated precursor of M [membrane protein]) and E (envelope protein): the proper folding of prM bearing unprocessed N-linked oligosaccharide is inefficient, and this causes delayed formation of prME heterodimer. The complexes formed between incompletely folded prM and E appear to be unstable, leading to a nonproductive pathway. Inhibition of alpha-glucosidase-mediated N-linked oligosaccharide trimming may thus prevent the assembly of DEN virus by affecting the early stages of envelope glycoprotein processing.

Flavivirus protein NS5 harbors the RNA-dependent RNA polymerase (RdRp) AΒ activity. In contrast to the RdRps of hepaci- and pestiviruses, which belong to the same family of Flaviviridae, NS5 carries two activities, a methyltransferase (MTase) and a RdRp. RdRp domains of Dengue virus (DV) and West Nile virus (WNV) NS5 were purified in high yield relative to full-length NS5 and showed full RdRp activity. Steady-state enzymatic parameters were determined on homopolymeric template poly(rC). The presence of the MTase domain does not affect the RdRp activity. Flavivirus RdRp domains might bear more than one GTP binding site displaying positive cooperativity. The kinetics of RNA synthesis by four Flaviviridae RdRps were compared. In comparison to Hepatitis C RdRp, DV and WNV as well as Bovine Viral Diarrhea virus RdRps show less rate limitation by early steps of short-product fort-nation. This suggests that they display a higher conformational flexibility upon the transition from initiation to elongation. (c) 2006 Elsevier Inc. All rights reserved.

Dengue (DEN) is the most important vector-borne disease in tropical countries. DEN disease is caused by dengue virus, a member of the flavivirus genus (family Flaviviridae). DEN is one major health concern in humans. DEN virus causes a spectrum of illnesses, ranging from a flu-like disease to DEN hemorrhagic fever, a fulminating illness that can progress to a shock syndrome and death. The pathogenesis of DEN disease is not well understood. Infection of target cells with DEN virus induces apoptosis. Changes in virus life cycle may account for differences in apoptosis induction. Determinants that may be relevant to DEN virus pathogenicity have been identified in the envelope E protein and viral helicase NS3. Intracellular synthesis of DEN envelope glycoproteins prM and E was sufficient to cause cell death. Induction of apoptosis may be linked to the presence of a pro-apoptotic sequence in the C-terminal region of prM.

PRIORITY APPLN. INFO: FR 2004-5366 20040517 AB FR 2870126 A UPAB: 20051205

NOVELTY - Use of a recombinant lentiviral vector (A) to prepare an immunogenic composition for prevention and/or treatment of infections by Flaviviridae, where (A) includes a polynucleotide fragment (I) that encodes at least one protein (II) from a virus of the family Flaviviridae or an immunogenic **peptide** (IIa), of at least 8 amino acids, from (II).

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

(1) (A), As defined, that contains a polynucleotide that encodes at least one structural protein (or fragment) and optionally a non-structural

protein (or fragment);

- (2) cells, preferably eukaryotic, modified by (A);
- (3) method for producing proteins of Flaviviridae and/or their immunogenic fragments or viral pseudoparticles, by culturing cells of (2);
- (4) method of screening for antiviral compounds using the cells of (2);
- (5) method for diagnosing infection by Flaviviridae in a biological fluid by detecting antibody-antigen complex formation with the cells of (2) or pseudoparticles of (3); and
 - (6) kit for methods (4) and (5) that contains the cells of (2). ACTIVITY - Virucide; Hepatotropic; Antiinflammatory.

MECHANISM OF ACTION - Vaccine. Lentiviral vector TRIP Delta U3.CMV-Es(WNV), containing a 1.4 kb cDNA from West Nile virus (WNV), was used to immunize mice, at an intraperitoneal dose of 1 mu g. The anti-WNV antibody titer was 104 after 14 days and 2 plus or minus 105 after 23 days, with titer of antibodies that neutralize 90% of WNV loci of infections 10 and 20, respectively.

USE - (A) Are used to produce immunogenic compositions (vaccines) for treatment and/or prevention of Flaviviridae infections in humans and animals, particularly West Nile virus, dengue, yellow fever and hepatitis C.

Cells transformed with (A) are useful:

- (i) for preparing proteins, or their immunogenic fragments, from Flaviviridae;
 - (ii) in screening for antiviral agents; and
 - (iii) to diagnose Flaviviridae infections.

ADVANTAGE - (A) Induces a strong response; particularly it targets antigen-presenting cells and (I) becomes integrated into the genome, ensuring stable expression in vivo, especially in dendritic cells, eliminating the need for repeated administrations. (A) Is non-replicative; non-tumorigenic; not species restricted and does not require adjuvants. Dwg.0/5

PRIORITY APPLN. INFO: FR 2001-4598
AB WO 200281741 A UPAB: 20030121

NOVELTY - Identifying (M1) compounds (I) that can stimulate a gene (II) of the OAS (2'-5'-oligoadenylate synthase) family comprising:

20010404

- (a) inducing expression of the OAS gene in a culture of cells from a non-human mammal (Flvr/Flvr or Flvr/Flvs; indicating resistance or sensitivity to Flavivirus infection);
 - (b) treating cells with test compound; and
- (c) measuring activity of (II) relative to a control, is new. DETAILED DESCRIPTION - Identifying (M1) compounds (I) that can stimulate a gene (II) of the OAS (2'-5'-oligoadenylate synthase) family
- comprising:
 (a) inducing expression of the OAS gene in a culture of cells from a non-human mammal (Flvr/Flvr or Flvr/Flvs; indicating resistance or sensitivity to Flavivirus infection);
 - (b) treating cells with test compound; and
 - (c) measuring activity of (II) relative to a control, is new.
- Step (a) involves addition of interferon (IFN) alpha or beta , or application of calcium stress, particularly addition of EGTA (ethylene glycol tetraacetic acid).

INDEPENDENT CLAIMS are also included for the following:

- (1) genomic mammalian DNA (III), optionally human, corresponding to a locus for resistance to Flavivirus infection;
- (2) evaluating (M2) sensitivity of an individual to Flavivirus infection and/or response to treatment with IFN;
- (3) reagent (IV) for the new method containing specific primers or probes;
- (4) transformed eukaryotic cells (V) containing (III), the corresponding cDNA or encoded proteins;
- (5) non-human transgenic mammals (VI) that include at least one copy of (III) or the corresponding cDNA; and
- (6) non-human transgenic mammals (VII) that contain at least one inactivated allele of an OAS gene.

ACTIVITY - Virucide; Hepatotropic; Antiinflammatory.

Primary rat neurons (from animals homozygous for the Flvs allele) were incubated for 2 hr in medium containing EGTA (causing a 350% increase in transcription of the OAS gene), then tested for infection by the neurovirulent IS-98-ST1 strain of West Nile virus. Treatment with EGTA caused a 50% reduction in the number of cells positive for viral antigen 24 hr after infection.

MECHANISM OF ACTION - Replacement or modulation of OAS activity, loss of which is associated with sensitivity to Flavivirus infection.

USE - Genomic nucleic acids, the corresponding cDNAs (also related vectors and cells containing such vectors), or their encoded proteins, are useful for screening for antivirals for treating Flavivirus infection (claimed). (I) are potentially useful as antiviral agents for treating infections by Flaviviruses (e.g. hepatitis C; dengue; yellow fever and varoious forms of encephalitis). Genomic OAS DNA and derived cDNA, also the encoded proteins, are useful:

(a) for treating Flavivirus infection;

(b) in screening for anti-flavivirus agents, and

(c) for evaluating sensitivity of subjects to Flavivirus infection and their likely response to IFN treatment, e.g. to identify patients at risk of developing severe forms of such infections Dwg.0/17

NOVELTY - Inducible expression system (A), for mammalian cells (human or non-human) or insect cells, includes an insert comprising:

- (i) a sequence that encodes at least one flavivirus envelope protein (FEP);
 - (ii) a selection gene; and
- (iii) optionally a gene that encodes a cellular hormone receptor. DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:
 - (1) selection methods using (A); and
- (2) inhibitors (IV) of flavivirus (FV), able to inhibit association of FEP produced in (A).

ACTIVITY - Antiviral.

MECHANISM OF ACTION - Modulating folding of, and interactions between, FEP, particularly by inhibition of alpha -glucosidase which is essential for protein maturation before virion assembly.

USE - (A) is used:

- (i) to test efficiency of potential inhibitors directed against FEP;
- (ii) to test folding and efficiency of association of FEP;
- (iii) to validate inhibitory activity of drugs;

Franco Salvoza 10/608,029

- (iv) for in vivo or in vitro evaluation of the protective capacity of agents that prevent cytotoxicity of FEP; and
- (v) to identify, in vivo or in vitro, cellular genes that are activated in response to FEP.

Inhibitors identified using (A) are potentially useful for treating flavivirus infections, particularly the various forms of dengue fever, yellow fever, hepatitis C and G, or Japanese/tick-borne encephalitis.

New isolated and purified ApoptoM peptide comprises 9 amino acids, useful as a vaccine for preventing or treating pathological conditions from nonspecific febrile illnesses to severe hemorrhagic manifestations or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gene therapy, protein purification, virucide, cytostatic, vaccine, hemorrhage, bleeding, infection, flavivirus infection, neoplasm, cancer, DEN, dengue, EGFP, enhanced green fluorescent protein.
                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to an isolated and purified ApoptoM peptide. The invention is useful as a vaccine for the prevention and treatment of pathological conditions from non-specific febrile illnesses to severe hemorrhagic manifestations, encephalitic syndromes and these pathological conditions are linked to Flavivirus infection or cancers. The invention is also useful in gene therapy. The present sequence is a MI-40/DEN (dengue)-2 (F36) mutant protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                   The present invention relates to an isolated and purified ApoptoM peptide. The invention is useful as a vaccine for the prevention and treatment of pathological conditions from non-specific febrile illnesses to severe hemorrhagic manifestations, encephalitic syndromes and these pathological conditions are linked to Flavivirus infection or cancers. The invention is also useful in gene therapy. The present sequence is a p(95-114) EGFP (enhanced green fluorescent protein) (M1-M40)DEN (dengue)-2 (136F) plasmid DNA encoded protein.
                                                                                                                            New isolated and purified ApoptoM peptide comprises 9 amino acids, useful as a vaccine for preventing or treating pathological conditions from non-specific febrile illnesses to severe hemorrhagic manifestations or

The invention provides novel G coupled protein receptor (GPCR) proteins and polynucleotides encoding the same. The novel GPCR (NGPCR) proteins can be expressed by standard recombinant methodology. The NGPCR proteins and polynucleotides are useful for diagnosis, in treatment of diseases, care behavioural disorders, for the detection of mutant GPCRs or inappropriately expressed GPCRX for the diagnosis of disease, and for screening drugs effective in the treatment of the symptomatic or phenotypic manifestations of perturbing the normal function of GPCR in phenotypic manifestations of perturbing the normal function of other care are against a seagents in diagnostic assays, for the identification of other callular gene products related to a GPCR, as reagents in assays for callular gene products related to a GPCR, as reagents in assays for callular gene products related to a GPCR, as reagents in assays for callular gene products related to a GPCR, as reagents in assays for creening compounds that can be used as pharmaceutical reagents for the therapeutic treatment of mental, biological or medical disorders and diseases, and for identifying compounds useful in the therapeutic treatment of obesity, inflammation, immune disorders, diabetes, heart and
                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polypeptide, useful for generation of antibodies and for screening compounds for treatment of mental, biological or medical disorders and diseases, comprises the isolated G coupled protein receptor polypeptide.
                                      The present invention provides the protein and coding sequences of a human guanosine triphosphate-binding protein-coupled receptor (GPCR). sequences are useful for treating diseases related to the abnormality the expression of GPCR, and for developing a therapeutic agent for medical treatment. The present sequence is a protein shown in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Turner CA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated polynucleotide which: (a) encodes a human secretin-type G protein-coupled receptor (GPCR) polypeptide; (b) comprises a sequence appearing as ABX12278 and ABX12279; (c) hybridises under stringent conditions to the polynucleotide in (A) and (B); (d) has a sequence deviating from (A)-(C) due to the degeneration of the genetic code; or represents a fragment, derivative or allelic variation of (A)-(D). Also included are an expression vector containing the above polynucleotide, a host cell containing the above substantially purified human secretin-type GPCR polypeptide, methods of screening for agents which modulate or decrease the activity of a human
 coronary disease, metabolic disorders, and cancer. The present sequence

secretin-type GPCR, methods of reducing the activity of the human secretin-type GPCR, the identified modulators. The polynucleotide is to useful in preventing, ameliorating, or treating diseases associated with human secretin-type GPCR dysfunction. The polynucleotide may also be used as hybridisation probes or primers, and in diagnostic assays or in gontic testing. The methods are useful in producing and detecting the colynucleotide and polypsptide and in screening for agents that modulate the activity of the human secretin-type GPCR. The expression vector or the reagent is useful in preparing a medicament for modulating the activity of a human secretin-type GPCR. The expression vector or the reagent is useful in preparing a medicament for modulating the cardiovascular disorder, obseity, diabetes, infections (bacterial, viral, fungal and protozoan), HIV (human immunodeficiency virus) infection, candiovascular disorder, obseity, diabetes, infection, osteoporosis, andina pectoris, wocardial infarction, unimary retention, osteoporosis, andina pectoris, myocardial infarction, unimary retention, osteoporosis, andina pectoris, manic depression, delirium, dementia, mental retardation, descretin type GPCR of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for generic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the inventor of produce of the inventor of precipilitation, but was obtained in electronic format directly from WIPO at the inventor of precipilitation, but was obtained in the two obtained in the inventor of the invent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GCREC; Human; G-protein coupled receptor; anti-HIV; antiarteriosclerotic; cytostatic; neuroprotective; antiparkinsonian; heparotropic; laxative; cerebroprotective; antinflammatory; virucide; antibacterial; fungicide; proteozoacide; cirrhosis; cancer; strok, Alzheimer's disease; AIDS; Parkinson's disease; Crohn's disease; constipation; infection; receptor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Tribouley CM, Nguyen DB, Thornton M, Yao MG, Gandhi AR, Walla NK, Arrizu C, Elliott VS, Hafalia AJA; Pei J, Tang YT, Yue H, Reddy R, Butford N, Lu DAM; Alan FA, Walsh RT, Ison CH, Richardson TW, Griffin JA; Yang J, Lee EA, Harland L;

                                                                                                                                      This invention describes novel polypeptides which have anti-HIV, antiparkinsonian, hepatotropic, cytostatic, neuroprotective, antiparkinsonian, hepatotropic, laxative, cerebroprotective, antiinflammatory, virucide, antibacterial, fungicide and protozoacide activity. The products of the invention are useful for treating a disease or condition associated with decreased expression or over expression of functional G-protein coupled receptors (GCREC), while antibodies generated against the polypeptide of the invention are useful for diagnosing a condition or disease associated with the expression of GCREC e.g. arteriosclerosis, cirrhosis, cancer, stroke, Alzheimer's disease, Parkinson's disease, Crohn's disease, stroke, Alzheimer's disease, Parkinson's disease, Crohn's disease, The compounds described in the invention can be used for gene therapy. AAF88627 described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cytostatic; antinflammatory; hepatotropic; nephrotropic; dermatological; antiathritic; antiasthmatic; antidiabetic; hypotensive; antiulcer; antilitemic; antiateriosclerotic; notropic; neuroprotective; anorectic; immunomodulaic; uropathic; antiinfertility; G-protein coupled receptor; GPCR, GPCR185; GPCR185; GPCR187; GPCR189; GPCR223; GPCR223; hepatitis; nephritis; dermatitis; pancreatitis; rheumatoid arthritis; osteoarthritis; atopic dermatitis; asthma; diabetes; hypertension; inflammatory bowel disease; gastric ulcer; arteriosclerosis; hyperlipemia; Alzheimer's disease; dementia; obesity; pulmonary fibrosis; renal fibrosis; immune deficiency; infertility; urinary blockage; cancer.
New human G-protein coupled receptors (GCREC), useful for diagnosing or treating a disease or condition associated with decreased expression or over expression of functional GCRECs e.g. cancer, Alzheimer's and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         G-protein coupled receptor proteins, genes encoding them and antibodies

and polynucleotides encoding the same. The novel GPCR (NGPCR) proteins can be expressed by standard recombinant methodology. The NGPCR proteins and polynucleotides are useful for diagnosis, in treatment of diseases, drug screening, clinical trial monitoring, for treatment of physiological or behavioural disorders, for the detection of mutant GPCRs or inappropriately expressed GPCRX for the diagnosis of disease, and for screening drugs effective in the treatment of the symptomatic or phenotypic manifestations of perturbing the normal function of GPCR in the body. The NGPCR proteins are useful for the generation of antibodies, as reagents in diagnostic assays, for the identification of other screening compounds that can be used as pharmaceutical reagents for the charapeutic treatment of mental, bhological or medical disorders and diseases, and for identifying compounds useful in the therapeutic creatment of obesity, inflammantion, immune disorders, diabetes, heart and cornary disease, metabolic disorders, and cancer. The present sequence creaments a human NGPCR protein

```
The invention relates to G-protein coupled receptor proteins of human origin. These proteins include GPCR185, GPCR187, GPCR187, GPCR189, GPCR222 and GPCR223. Proteins of the invention are used in the creatment and prevention of diseases associated with inflammation.

Creatment and prevention of diseases associated with inflammation, angiogenesis and tissue neogenesis, including hepaticis, nephritis, angiogenesis and tissue neogenesis, including hepaticis, nephritis, atopic dermatitis, asthma, diabetes, hypertension, inflammatory bowel disease, camentia, obesity, pulmonary fibrosis, renal fibrosis, immune deficiency, infertility, utinary blockage and cancer (such as cancer of the brain, confertility, worder, booked and cancer (such as cancer of the brain, confertility, womb or rectum). Primers of the invention are devised and synthesised based on G-protein coupled receptor consensus sequences and used for 5'-RACE (rapid amplification of CDNA ends) and 3'-RACE amplification of human CDNA derived from adrendl and visual cortex RNA. Sequences given in ADE34534-ADE34331 represent human G-protein coupled creceptor consensus sequences consensus contex RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to G-protein coupled receptor proteins of human origin. These proteins include GPCR185, GPCR187, GPCR188, GPCR189, GPCR189, GPCR189, GPCR189, GPCR189, GPCR189, GPCR189, GPCR189, GPCR223. Proteins of the invention are used in the treatment and prevention of diseases associated with inflammation, angiogenesis and tissue neogenesis, including hepatitis, nephritis, dermatitis, pancreatitis, rheumatoid arthritis, osteoarthritis, atopic dermatitis, asthma, diabetes, hypertension, inflammatory bowel disease, gastric ulcer, arterioscleroslis, hyperlipemia, Alzheimer's disease, dementia, obesity, pulmonary fibrosis, renal fibrosis, immune deficiency,
screened compounds are useful for developing drugs to treat central nervous diseases, endocrine diseases, metabolic diseases, cancer, inflammations, and diseases of the circulatory, respiratory, digestive and immune systems, and infections, and in gene therapy. This is the amino acid sequence of the human G protein-coupled receptor hTGR21-1, a novel protein isolated from human kidney
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      G-protein coupled receptor proteins, genes encoding them and antibodies recognizing them for treatment and diagnosis of cancer, inflammatory and

infertility, urinary blockage and cancer (such as cancer of the brain, neck, tongue, lung, breast, pancreas, stomach, colon, duodenum, prostate, bladder, ovary, womb or rectum). Primers of the invention are devised and synthesised based on G-protein coupled receptor consensus sequences and used for 5'-RACE (rapid amplification of CDNA ends) and 3'-RACE sequences given in ADB34534-ADB34533 represent human G-protein coupled receptor proteins, genes encoding them, and primers for the amplification of these sequences.
                                                                                                                                                                                                                                                                           Gaps

The invention relates to human and mouse G protein-coupled receptors (GPCRs) and nucleic acids encoding them. The invention also relates to sequences at least 90% identical to the GPCR proteins and nucleic acids of the inventing, preventing or diagnosing diseases associated with GPCRs of the inventing, preventing or diagnosing diseases. CC associated with GPCRs of the invention; a mouse comprising a transgenic compounds useful in the treatment of GPCR-related diseases; a transgenic mouse comprising a GPCR transgene or in an endogenous GPCR gene; cells derived from the trasngenic mice; kits comprising several mice, each of which has a mutation in a different GPCR polymoleotides of the invention. The invention further discloses variants of the GPCR polymoleotides of which has a mutation in the diagnosis, treatment or prevention of a wide variety of be used in the diagnosis, treatment or prevention of a wide variety of diseases including neurological disorders (e.g., Alzheimer's disease, disease including neurological disorders (e.g., Alzheimer's disease, disease including neurological disorders (e.g., Alzheimer's disease, disease, disease); bone and joint disorders (e.g., angina, cardiac arrhythmia or myodrome); cardiovascular disorders (e.g., angina, cardiac arrhythmia or myodrome); cardiovascular disorders (e.g., angina, cardiac arrhythmia or myodrome); bone and joint disorders (e.g., angina, cardiac arrhythmia or myodrome); and disorders (e.g., angina, cardiac, overy, anamemia or leukaemia); immunue disorders; blood disorders (e.g., aucimunue disorders or contained disorders (e.g., aucimunue disorders or contribute, prostace, testis, skin, stomech, pancreas, spoten, thymus and thymus and disorders (e.g., aucimunue disorders or cuteruic, prostace, testis, skin, stomech, pancreas, spoten, thymus and thymus and disorders (e.g., angina, and disorders or the kidney, liver, lung, breast, thymus and clicancers); and every dispersed or secopororish in the printed specification; those sequences not shown were obtained 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              receptor; GPCR; guanosine triphosphate-binding protein-coupled receptor; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                  The present invention provides the protein and coding sequences of a human guanosine triphosphate-binding protein-coupled receptor (GPCR). The sequences are useful for treating diseases related to the abnormality of the expression of GPCR, and for developing a therapeutic agent for medical treatment. The present sequence is the protein of the invention.
                           New polynucleotide encoding guanosine triphosphate-binding protein-
coupled receptor, for use in developing a therapeutic agent for medical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human, G-protein coupled receptor, GCREC, olfactory, taste sensation, cell proliferative disorder; actinic Keratosis; leukaemia; metabolic; epilepsy, Alzheimer's disease, cardiovascular, hypertension, virucide, angina pectoris; myocardial infarction; gastrointestinal; anorexia; cholecystitis; Crohn's disease, inflammatory; hypotensive; cardiant; acquired immune deficiency syndrome; anaemia; asthma, hepatotropic; diabetes; obesity; infection; transgenic; gene therapy; cytostatic; anticonvulsant; neuroprotective; antiinflammatory; neurological; nootropic; antoimmune; receptor.

The invention relates to human G-protein coupled receptors (GCREC) and their corresponding nucleic acids. GCREC is useful in screening for compounds which acts as its agonist or antagonist and is also useful for preparing a polyclonal or monoclonal antibody. GCREC is useful for dentifying a compound that modulates, mimics and/or blocks an olfactory and/or taste sensation. GCREC DNA is useful for assessing toxicity of a cest compound. GCREC and its DNA are useful in the diagnosis, treatment at test compound. GCREC and its DNA are useful in the diagnosis, treatment and prevention of a cell proliferative disorder e.g. actinic keratosis, lenkamaia, etc., a neurological disorder e.g. epilepsy, Alzabeimer's disease, etc., a cardiovascular disorder e.g. epilepsy, Alzabeimer's concravia, cholocysticis, Crohn's disease, etc., an autoimmune/ inflammatory disorder e.g. acquired immune deficiency syndrome, anaemia, asthma, etc., a metabolic disorder e.g. diabetes, obesity, etc., and an inflammatory disorder e.g. diabetes, obesity, etc., and an inflammatory for treating knock out or knock in humanised animals or transgenic animals to model human diseases, and sommation germline gene therapy for treating the above mentioned disorders. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; receptor; GPCR; G protein-coupled receptor; secretin; obesity; cardiovascular disorder; diabetes; infection; HIV; pain; cancer; human immunodeficiency virus infection; anorexia; bulimia; asthma; Parkinson's disease; acute heart failure; hypotension; hypotension; urinary retention; osteoporosis; angina pectoris; myocardial infarction; ulcer; allorgy; banjan proseatic hypertophy; psychosis; neurological disorder; anxiety; schizophrenia; manic depression; delirium; dementia; mental retardation; dyskinesia; Huntington's disease;

The invertion relates to an isolated polynucleotide winch: (a) encodes a human secretin-type G protein-coupled receptor (GPCR) polypeptide; (b) comprises a sequence appearing as ABX15278 and ABX15279; (c) hybridises under stringent conditions to the polynucleotide in (A) and (B); (d) has a sequence deviating from (A) (C) due to the degeneration of the genetic code; or represents a fragment, derivative or allelic variation of (A) or code; or represents a fragment, derivative or allelic variation of (A) or code; or represents a fragment, derivative or allelic variation of (A) or code; or represents a fragment, derivative or allelic variation of (A) or substantially purified human secretin-type GPCR polymetleotide, methods of substantially purified human secretin-type GPCR polymetleotide, methods of reducing the activity of the human secretin-type GPCR, the identified modulators, The polymetleotide is secretin-type GPCR, the identified modulators, The polymetleotide is secretin-type GPCR, the identified modulators, The polymetleotide with human secretin-type GPCR, as a secretin-type GPCR dysfunction. The polymetleotide and polymetleotide and in screening for assents as a solution probes or primers, and in diagnostic assays or in copymication probes or primers, and in diagnostic assays or in the activity of the human secretin-type GPCR. The expression vector or the activity of the human secretin-type GPCR. The expression vector or corrections and protozoan), HIV (human immunodeficiency virus) infection, fundal and protozoan), HIV (human immunodeficiency virus) infection, or angina pectoris, morexia, bulimia, asthma, parkinson's disease, acute heart cfallure, hypotension, hypertension, urinary retention, osteoporosis, angina pectoris, myocardial infarction, urinary retention, osteoporosis, and and protozoan), HIV (human immunodeficiency virus) infection, dyskinesias, Huntington's disease and Tourette syndrome). The present corrections descent and and and recretin-type GPCR and in energin presents a human secretin ty
                                                                                                                                                                                                         coupled receptor (GPCR) polypeptides, useful for preventing or treating diseases associated with GPCR dysfunction, e.g. cardiovascular disease or

This invention relates to a novel method of identifying ligands to an orphan receptor protein which comprises transforming cells with DNA encoding a fusion protein of the orphan receptor with a fluorescent protein, so that the fusion protein is expressed in the cells (or cell membranes isolated from them) and contacting the cells with the potential ligand to be tested. A suitable fluorescent protein for incorporation in the fusion protein is green fluorescent protein (GFP), for example GFP-1, wild-type GFP, GFPP or or or protein for the identification of ligands binding to an orphan receptor protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bioinformatics; blood; serum; plasma protein; protein detection; mass spectroscopy; proteomics; glycosylation; diagnosis; cancer; cytostatic, diabetes; antidiabetic; inflammation; antinflammatory; rheumatoid archritis; antiarthritic; antirheumatic; psychiatric disorder; neuroleptic; neurological disease; infection; antimicrobial.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, ollgomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) as useful in gene therapy techniques to restore normal useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating a useful for generating antibodies against it, detecting or quantitating of supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations in diagnostics for genetic disorders or other traits to assess biodiversity responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic maino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at

The invention relates to identifying glycopolypeptides in a serum or plasma sample comprising immobilizing derivatized sample
C glycopolypeptides to a solid support, releasing the sample glycopoptide
C fragments from the solid support, adding to the released sample
C glycopoptide fragments standard peptides, and identifying released sample
C glycopeptide fragments that correspond to standard peptides added by mass
CC glycopeptide fragments that correspond to standard peptides added by mass
CC diagnostic markers for a disease, a composition comprising peptides
CC diagnostic markers for a disease, a composition comprising peptides
CC containing the glycosylation sites (AEE35897-AEE39378, where the peptides
CC containing the same cleavage reagent) and a kit comprising peptides containing
CC containing the same cleavage reagent) and a kit comprising peptides
CC diagnostic protein markers. It can a serum or plasma sample. The methods
CC diagnostic protein markers. It can also be used to identify and/or
CC drug toxicity. The methods can also be used to identify and/or
CC validate drug targets and to evaluate drug efficacy, drug dosing, and/or
CC validate drug targets and to evaluate drug efficacy, drug dosing, and/or
CC validate drug targets and to evaluate drug efficacy, drug dosing, and/or
CC validate drug targets and to evaluate drug efficacy, drug dosing, and/or
CC validate of glycosylation of proteins based on the concurrent
CC the same sample. The method allows fast throughput and simplicity. It can
CC particularly advantageous for the analysis of samples, which can be
CC particularly advantageous for the analysis of samples. The present sequence is a human glycopeptide comprising an N-
CC method of the invention.
Identifying glycopolypeptides in a serum or plasma sample, by identifying released sample glycopeptide fragments that correspond to standard
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

these polypeptides. The sequences of the invention are useful for preventing, treating and/or prognosing disorders related to the respiratory system including throat disorders (e.g. vocal cord paralysis, tonsillities, and laryngitis), lung disorders e.g. pneumonia, allergic disorders e.g. asthma, pleurisy, cystic fibrosis, emphysema, nose disorders and cancers of the respiratory tissues e.g. lung cancer. The polymucleotide sequences of the invention are useful in gene therapy and antisense therapy. AMUTA68-AMUTA75 represent novel human respiratory antisens the sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              respiratory system antigen; human respiratory system associated polynucleotide; respiratory system associated polynucleotide; respiratory system disorder; throad disorder; vocal cord paralysis; tonsillitis; laryngitis; lung disorder; pneumonia; allergic disorder; asthma; eosinophilic pneumonia; pleurisy; cystic fibrosis; emphysema; histlocytosis; sarcoidosis; nose disorder; rhinitis; sinusitis; neoplasm; cancer; respiratory tissue cancer; throat cancer; lung cancer; cancer of the nose; gene therapy; chromosome identification; forensic; human respiratory system associated protein; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             antiinflammatory; antiallergic; antiasthmatic; cytostatic; gene therapy;

Novel respiratory system antigen and polynucleotides encoding the polypeptides, useful for treating diagnosing, treating or preventing tonsillitis, pneumonia, asthma and cystic fibrosis, emphysema, throat cancer.

Claim 11; SEQ ID NO 387; 236pp; English

The invention describes an isolated polypeptide (I) comprising an amino acid sequence that is at least 90% identical to polypeptide fragment of any one of 299 respiratory system antigen sequences (PS) and having biological activity, polypeptide domain or epitope of PS, full-length protein of PS, or variant, allelic variant or species homolog of PS. (I) protein of PS, or variant, allelic variant or species homolog of PS. (I) pathological condition or a susceptibility to a pathological condition in a subject which involves determining the presence or absence of mutation in (II) or determining the presence or amount of expression of (I) in a biological sample and diagnosing a pathological condition based on the result. The human respiratory system associated polynucleotides, the polypeptides encoded by them, and antibodies that immunospecifically bind these polypeptides are useful in diagnosis, treatment, prevention and/or prognosis of disorders of respiratory system such as throat disorders

Human novel polypeptide #76

17-JAN-2003

```
This invention is related to a novel isolated polypeptide, which comprises a human respiratory system-related polypeptide, and the DNA acquence which encodes it. The invention may be useful for the development of compounds with an antiasthmatic, antialacterial, antiinflammatory, cytostatic, antianasthmatic, antialacterial, antiinflammatory, cytostatic, antianasthmatic, antialacterial, addition, the sequences disclosed may be useful for gene therapy. The polypeptide or polynucleotide is useful for treating, preventing or ameliorating a medical condition, for example pneumonia, lung cancer, cystic fibrosis, asthma, sarcoidosis, rhinitis, anaemia, leukaemia, inflammations, sinusitis, chronic obstructive pulmonary disease or infectious diseases. The polypeptic or polynucleotide is also useful for diagnosing any of these diseases or a susceptibility to the disease. The present sequence is that of a human respiratory system associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New human respiratory system-related polypeptide and genes, useful for treating, preventing or diagnosing e.g. pneumonia, lung cancer, cystic fibrosis, asthma, sarcoidosis, rhinitis, leukemia, inflammations or sinusitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 11; SEQ ID NO 387; 202pp; English.

The invention relates to human polynucleotides and the polypeptides they encode. The polynucleotides and polypeptides are useful in diagnostics, concode. The polynucleotides and polypeptides are useful in diagnostics, forensics, gane mapping, medical imaging, identification of mutations are responsible for genetic disorders or other traits, assessing biodiversity and producing many other types of data and products dependent on DNA and amino acid sequences. They are also useful for preventing, treating or ameliorating medical conditions, such as cancer, neurodegenerative disorders, of secoporosis, osteoathatitis, bone degenerative disorders, periodontal disease, liver fibrosis, infections (e.g. viral, fungal or periodontal disease, liver fibrosis, infections (e.g. viral, fungal or sequences ABG99888-ABG9998 and ABU00010-ABU00433 represent human to polypeptides of the invention. Note: The sequence data for this patent is infermation and is not repeased in the printed specification but is based on sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         55.6%; Score 5; DB 6; Length 52; 100.0%; Pred. New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.

Example 1; SEQ ID NO 4038; 1481pp; English.

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SABHO syndrome (synovitis, acne, pustulosis, Mypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The acnes polypeptides and therefore treat P. acnes infections. The acnes prosesses of the downregulate appression and activity of P. acnes prosesses for example, by enzyme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;

The invention relates to an isolated polymucleotide (ACF64435-ACF64733)

cncoding a Propionibacterium acnes protein. The invention also relates to polymeptides encoded by the polymucleotides (ABM35624-ABM6435) and to immunogenic fragments of P. acnes polymeptides. The invention additionally encompasses expression vectors and host cells comprising a content of the invention, additionally encompasses expression vectors and host cells comprising a polymeptide of the invention; an invention; fusion proteins comprising a polymeptide of the invention; a method for stimulating an immune response specific for a P. acnes polymeptide and an isolated T cell population comprising T cells prepared to the invention; and till properties, fusion proteins, T cell populations, or antigen-presenting cells that express the polymeptide); a method and kit of a detecting or determining the presence or absence of P. acnes in a patient; The P. acnes polymeptides, polymercleotides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the polymeptides are useful for diagnosing, preventing or treating acnes proteins, T cell populations or antigen-presenting cells that express the protein. The polymucleotides can also be used as probes or primers for uncleic acid hypridisation; he vaccine composition is useful for the crimulation of an immune response against P. acnes, or for treating accorded by an ORF (open creding frame) contained within the P. acnes polymucleotides of the creating frame) contained within the P. acnes polymucleotides of the creating for the printed specification, but was obtained in electronic format directly the print of the printed specification, but was obtained and the for the printed specification, but the printed specification, but the printed specification, but the printed specification, the printed specification, but the pri
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (1) amino acid sequences given in AAM8210 to AAM91921. (1) have cytostatic activity, and can be used in gene therapy and vaccine production. (1) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (1) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (1) by expressing inactive proteins or to polynucleotides may be used to produce the secreted (1). Additionally, (1) polynuclectics and be not cell and culturing the cell to express the protein. (1) proteins and polynucleotides may be used to prevent, classing and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic-derived cells. AAK64703 concers and cancer metastases of haematopoietic antigen genomic sequences from the present invention. AAK54921 to AAK5450 and AAM82169 represent invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cell death protective, apoptosis, necrosis, human, drug screening, cell death-associated disorder, central nervous system disorder; psychiatric disorder; neurological disorder; ischaemia-related disorder; stroke, cerebral infarction; ischaemic encephalopathy; neurodegenerative disorder, latchaemis encephalopathy; strokes of sease; parkinson's disease; huntington's disease; Parkinson's disease; infection; meningitis; malaria; trypanosomiasis; vascular disease; opthalmological disorder; diabetic retinopathy; atheroserieros; hypertension; myocardial infarction, atheroseis; respiratory disorder; asthma; transgenic animal; chronic obstructive pulmonary disease; neoplastic condition; cancer;

Compences AAH84132-AAH84370 represent human nucleic acid sequences which protect against cell death (i.e., apoptosis or necrosis). Sequences or correct against cell death (i.e., apoptosis or necrosis). Sequences or correct against cell death (i.e., apoptosis or necrosis). Sequences or AH8441815. AAH84115. AAH84170, AAH842101, AAH84216, AAH84365.

AAH841813. AAH84115 and AAH84367 represent 10 full-length cDNA clones.

AH8418135. AAH84115 and AAH84367 represent 10 full-length cDNA clones.

AGGS8610-AAG38829 represent the polypeptides encoded by the cell death corrective ORRs. The cell death protective ORNs clones are able to protective ORRs. The cell death protective ORNs clones are able to protective ORRs. The cell death protective ORNs clones associated with cell cath, and to screen for compounds which medulate their activity or severem for compounds which medulate their activity or antibody, a ribozyme, or an antisense molecule, can also be used in the diagnosis and treatment of disorders associated with cell cath, and to screen for compounds which medulate these associated with call cath, related diseases. Such diseases include those associated with the central nervous system including psychiatric or neurological call cath, related diseases. Such diseases include those associated with the cell death-related diseases. Such diseases include those associated with the cell death-related diseases. Such diseases includes neurologenerative disease. The medulators may also be used to treat infections such as ischaemic encephalopathy or cerebral inferction is used to treat infections such as sichaemic encephalopathy or meculation; conditions such as athma or chronic obstructive pulmonary disease; conditions such as anaemia; gastrointestinal conditions such as dermatitis or utticaria; or immune system disorders and disorders such as grawe's disease.

Conditions such as dermatitis or utt
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel protective sequence polynucleotides and polypeptides, used to identify modulators of their expression and activity, which are used in to treat central nervous system conditions, diseases and disorders.
                        disorder;
benign tumour; anaemia; gastrointestinal disorder; gastritis; ulcerative colitis; liver disease; biliary cirrhosis; kidney disorder. glomerulonephritis; cystitis; endometriosis; endocrine disorder; farave's disease; Hashimoto's thyroiditis; skin condition; dermatitis; urticaria; immune disorder; acquired immunodeficiency syndrome; AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                     Katz LC;

Propionibacterium acnes immunogenic protein #10928. Skeiky YAW, Persing DH, Mitcham JL, Wang SS, L'maisonneuve J, Zhang Y, Jen S, Carter D; dermatological; osteopathic; neuroprotectant. Example 1; SEQ ID NO 11227; 1069pp; English. AAU50032 standard; protein; 64 02-JUN-2000; 2000US-0208841P. 20-APR-2001; 2001WO-US012865 21-APR-2000; 2000US-0199047P (first entry) Propionibacterium acnes treating acne vulgaris. WPI; 2001-616774/71. (CORI-) CORIXA CORP. 24 WFLRH 28 N-PSDB; AASS9546. Sequence 64 AA; WO200181581-A2 27-FEB-2002 01-NOV-2001 AAU50032; RESULT 27 AA GESTANDER DE LES DE 셤

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis.

C. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a maple with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies speciality for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as therefore treat P. acnes infections. The acnes protein for a presence, for example, by enzyme liked immunoschbar assay. More. The sequence of the acceptance designed to a protein in the production of antibodies and the acres infections. The acnes protein and activity of P. acnes polypeptides and the acceptance of the diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at obtained in electronic format directly fi ftp.wipo.int/pub/published_pct_sequences

The invention relates to an isolated polymuclectide (ACF64435-ACF64733).

Checoding a Propionibacterium acnes protein. The invention also relates to polymebrides encoded by the polymuclectides (ABM35624-ABM64536) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a additionally encompasses expression vectors and host cells comprising a comprising a polymeptide of the invention; and invention, antibodies appeared of the invention; a comprising a polymeptide of the invention; a comprising a polymeptide of the invention; a composition (comprising P. acnes polymeptides, via this method; a vaccine composition (comprising P. acnes polymeptides, polymeptides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polymeptide); a method and kit cfor detecting or determining the development of P. acnes in a cartigen-presenting cells that express the polymeptides, po

in the specification). ABN15762 to ABN27252 encode the human ORFX in the specification). ABN15762 to ABN27252 encode the human ORFX in the specification). ABN15762 to ABN27252 encode the human ORFX in the specification). ABN15762 to ABN27252 encode the human ORFX tracting given in ABN900101 to ABP11300. ORFX proteins are useful for tracting or preventing a pathology associated with an ORFX-associated disorder. ORFX polymucleotide syndrome associated with ORFX-associated disorder. ORFX polymucleotide syndrome associated with ORFX-associated disorder. ORFX polymucleotide recent cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumours, keloid, degenerative disorders related to organ transplantation, cardiovascular disorders, disorders related to organ transplantation. Cardiovascular disorders, disorders related to organ transplantation, cardiovascular disorders, disorders, infectious storage disease, various immune deficiencies and disorders, infectious arthritis, autoimmune disorders such as multiple sclerosis, rheumatoid arthritis, autoimmune thyroiditis, myasthenia gravis, graft-versus-host disease and autoimmune inflammatory eye disease. ORFX proteins are also

Sequences AAH84135, AAH84170, AAH84210, AAH84212, AAH84125, AAH84126, AAH84210, AAH84210, AAH84226, AAH8425, AAH84281, AAH84315 and AAH8437 represent 10 full-length cDNA clones, while the remaining nucleic acid sequences within the range given above represent the open reading frames (ORFs) of these cDNA clones. Sequences AAG98610-AAG98829 represent the polypeptides encoded by the cell death protective cDNA clones are able to prevent, delay or reverse progression through the apoptotic or necrotic pathways when injected into a cell predisposed to or undergoing cell death. The cell death protective nucleic acids and polypeptides can be

         used, in the diagnosts and treatment of deachs associated with cell death, and to screen for compounds which modulate their activity or expression. Such modulators, preferably a small organic molecule, an entibozyme, or an antisense molecule, can also be used to treat cell death-related diseases. Such diseases include those associated with the central nervous system including psychiatric or neurological calsorates, especially ischaemia-related conditions such as strokes, and also includes neurodegenerative disease. The modulators may also be thuntington's disease, or Parkinson's disease. The modulators may also be conditions to treat infections such as meningitis, malaria, or trypanosomiasis, vascular diseases such as ischaemic encephalopathy or crebral infarction; eye conditions such as ischaemic encephalopathy or macular diseases.

Conditions such as asthma or chronic obstructive pulmonary disease; conditions such as anaemia; gastrointestinal conditions such as gastritis or ulcerative colitis; liver conditions such as biliary cirrhosis, kidney disorders such as glomerulonephritis; cystitis; endometriosis; endocrine conditions such as glomerulonephritis; cystitis; endometriosis; endocrine conditions such as disease or Hashimoto's thyroiditis; skin conditions such as disease or Hashimoto's thyroiditis; endocrine conditions such as dismatlish or urticaria; or immune system disorders such as glomerulonephritis; cystitis; endometriosis; endocrine conditions used as acquired immunodeficiency syndrome (AlDS). The nucleic acids may additionally be used to generate animal models of cell death-associated disorders. The present septements a cell death protective

The invention relates to novel excretory system related human polynucleotides (AA198567-AA199503) and the encoded proteins (AAM99594-AAM99913) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therappy, especially disorders related to the excretory system. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Isolated nucleic acid molecule encoding excretory system antigen is in preventing, treating or ameliorating a medical condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 11; SEQ ID NO 581; 574pp + Sequence Listing; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Rosen CA, Barash SC, Ruben SM;

Claim 11; SEQ ID NO 528; 564pp + Sequence Listing; English.

New isolated nucleic acids and polypeptides, useful for diagnosing treating and/or preventing human diseases and disorders.

The invention relates to novel kidney related polynucleotides (AAI62971-AAI63793) and the encoded polypeptides (AAM42417-AAM42691) collectively kands as kidney antigens and the use of such kidney antigens for detecting disorders of the kidney, especially kidney cancer and kidney cancer metastases. The polynucleotides and proteins are also useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues cisclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of isolosed in the specification. The nucleic acids, proteins, and cand jand, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, allergies, autoimmune disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular diseases such as viral, my cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic infections. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequences ABP31028-ABP35561 represent 4534 novel human proteins designated ORF (open reading frame) 1-4534, and sequences ABN75054-ABN79587 represent cDNs encoding them. The invention also encompasses polypeptides at least 80% identical to the ORF1-ORF4534 (collectively referred to as ORFX) proteins, polynucleotides at least 85% identical to polynucleotides at least 85% identical to polynucleotides, nucleic acid sequences, vectors and host cells comprising ORFX polynucleotides, nethods of detecting ORFX proteins, antibodies specific for ORFY proteins, methods of screening for modulators of ORFX expression or activity, and methods of screening individuals for a predisposition to an ORFX-associated disorder. The ORFX proteins of the invention have a wide range of biological activities, such as cytokine, cell proliferation,

cell differentiation, immune modulation, haematopoiesis regulation, tissue growth, angiogenesis, activin or inhibin activity, chemotactic/conferentiationeric activity, thaemostatic activity, thrombolytic activity, cepeptor/ligand, antiinflammatory activity, tumour inhibition activity, receptor/ligand, antiinflammatory activity, tumour inhibition activity, and antiinflective activity, and may also be involved in the determination of bodily characteristics, fertility and behaviour. ORFX proteins.

CC f bodily characteristics, fertility and behaviour. ORFX proteins.

CC mucleic acids and antibodies may be used in the treatment of cancers, other proliferative disorders such as poorlasis and benign tumours, coller proliferative disorders such as epilepsy and Alzheimer's disease, cardiovascular diseases, immune system disorders; disorders related to organ transplantation, disorders of tissue growth and regeneration, disorders mellitus, hypothyroidism, and cholesterol ester storage diseases, and infections diseases caused by viral, bacterial, croarged diseases under infections diseases caused by viral, bacterial, activity and probes, in the detection of ORFX genomic sequences are contained in the detection and cloning of homologous contranscriptes, in the identification and cloning of homologous sequences, in genetic diseases in and in foremsic biology. The ORFX protein, and in drug screening. The ORFX proteins may also be used as immunogens to generate specific antibodies, which are useful in the cimmunogens to generate specific antibodies, which are useful in the cimmunogens to generate specific antibodies, which are useful in the cimmunogens to generate specific antibodies, which are useful in the cimmunogens to generate specific antibodies, which are useful in the

The invention relates a recombinant DNA construct comprising a polypeptide with any of 5544 and cadd sequences (CDNAs SEQ ID NO: 1-5544) and encoding a polypeptide with any of 5544 and oad a sequences (SEQ ID NO: 5545-11088) The CDNAs and proteins are from corn, sowbean, Arabidopsis, wheat and rape but the specification does not indicate which sequences is derived from which organism. Also included is a method of producing a plant having an improved property, comprising transforming a plant with a recombinant DNA construct comprising a promoter region of the areas of the property is selected from improving plant cold tolerance, for functional in a plant cell operably joined to a polymucleotide encoding a plant. The property is selected from improving plant cold tolerance, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for improving plant disease, for glactomanan production, for production of plant growth requisions, for increasing the rate of nomologous recombination in plants, for lightin production, for improving plant tolerance to extreme osmotic conditions, for improvement by modification of carbohydrate, hitrogen or phosphorus use and/or uptake and for yield improvement by providing improvement by modification of carbohydrate, hitrogen or phosphorus use and/or uptake and for yield improvement by providing improved plant growth and compositions of carbohydrate, hitrogen or phosphorus use and/or uptake and for yield improvement by providing improved plant growth and compositions of the present invention are useful in the field of biochemistry and encode a plant transcription factor. The methods and compositions of the present invention are useful in the field of biochemistry and improved and a present expense or pathogens. The pr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            sequences of the invention. Note: The sequence is one of the 5544 plant protein not form part of the printed specification, but was obtained in sequence formit format directly from USPTO at sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint; central nervous system; ELISA; inflammatory lesion; acne vulgaris; enrayme linked immunosorbent assay; dermatological; osteopathic; neuroprotectant.

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies oplypeptides may be used as antigens in the production of antibodies of polypeptides and activity of P. acnes polypeptides and contacting therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                      immunogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Propionibacterium acnes predicted ORF-encoded polypeptide #12713.

The invention relates to an isolated polynuclectide (ACF64435-ACF64733)
encoding a Propionibacterium acnes protein. The invention also relates to
polypeptides enroaded by the polynucleotides. The invention
immunogenic fragments of P. acnes polypeptides. The invention
additionally encompasses expression vectors and host cells comprising a
polymenteotide of the invention; antibodies against polypeptides of the
invention; fualon proteins comprising a polypeptide of the invention;
and an isolated T cell population comprising T cells prepared
constitutions this method; a vaccine composition (comprising P. acnes polypeptides,
polymenteotides, antibodies, fusion proteins, T cell populations, or
antigen-presenting cells that express the polypeptide); a method and kit
confecting or determining the presence or absence of P. acnes in a
patient; and a method for inhibiting the development of P. acnes in a
patient; and a method for inhibiting the development of P. acnes in a
patient; and a method for inhibiting the development of P. acnes in a
patient; and a method for inhibiting the development of P. acnes in a
patient; and a method for inhibiting the development of P. acnes in a
confecting or determining an information or treating acnes
confecting or define to a subspective, polymelectides, antibodies, fusion
proteins, T cell populations or antigen-presenting or treating acnes
convigation. The polymuclectides can also be used as probes or primers for
nucleic acid hybridisation. The vaccine composition is useful for the
convolation frame) contained within the P. acnes polymelectides of the

The invention describes a recombinant DNA construct comprising a polynucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, heablicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, increased resistance to plant disease, for increased resistance to plant disease, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one carress condition or for modifying seed oil or protein yield and/or content. This is the amino acid sequence of a plant full length insert polypeptide that can be used in the recombinant DNA construct of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The invention relates to a substantially purified nucleic acid molecule encoding a nitrite reductase of SEQ ID NO. 11926. Further disclosed is a recombinant DNA construct for expression of a nitrite reductase gene in a plant cell comprising the recombinant DNA construct. The nucleic acid is useful for determining gene expression, identifying mutations in a gene of interest, and for constructing mutations in a gene of interest. Sequences given in records for SEQ IDS 962-16825 represent a group of 7134 Mxycoccus xanthus proteins and peptides. Note: The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from USPTO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           anticonvulsant; nootropic; neuroprotective; cerebroprotective; anti-HIV; antialergic; antiinflammatory; thyromimetic; gene therapy; entering the cell proliferative disorder; endocrine disorder; neurological disorder; immune system disorder; inflammatory disorder; developmental disorder; reproductive disorder; vesicle-trafficking disorder; infection.
                                                                                                                                                                                                                                                                                                                                                                                 New substantially purified Myxococcus xanthus nucleic acid molecule encoding a nitrite reductase, useful for determining gene expression, identifying mutations in a gene of interest, and for constructing mutations in a gene of interest.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   enzyme; human; ENZM; cytostatic; antiarteriosclerotic; antidiabetic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A PRINCE OF A PRIN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to a novel isolated polynucleotide comprising a nucleotide sequence selected from one of 1680 sequences, a mature protein conding portion of them, an active domain of them and their complementary sequences. The invention may be useful for the production of compounds with an antiarthritic, antiparkinsonian, neuroprotective, nootropic, antibacterial, antiviral, antipusoriatic, antiparasitic activity. In addition, the disclosed sequences may be useful for gene therapy. The polypeptides or their antibodies are useful for treating many diseases such as arthritis, Parkinson's, Alzheimer's, autoimmune diseases, cancer, psoriasis, inflammatory bowel disease and infections caused by bacteria, viruses, fungi or parasites. The present sequence is that of a human polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Isolated polynucleotide encoding bone marrow derived polypeptides useful for treating, e.g., Parkinson's, Alzheimer's, cancer, arthritis, Crohn's disease, and inflammatory bowel disease.
                                                                                                                                                         1. .90

Protacanthopterygii, Salmoniformes, Retropinnidae; Retropinna.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              -i- FUNCTION: Component of the ubiquinol-cytochrome c reductase complex (complex III or cytochrome b-c1 complex), which is a respiratory chain that generates an electrochemical potential coupled to ATP synthesis (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -!- COFACTOR: Binds 2 heme groups noncovalently (By similarity).
-!- SUBUNIT: The main subunits of complex b-cl are: cytochrome b, cytochrome cl and the Rieske protein (By similarity).
-!- SIMILARITY: Belongs to the cytochrome b family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              55.6%; Score 5; DB 2; Length 87; 100.0%; Pred.
